Gittins Indices for Bayesian Optimization: Insights from Pandora's Box

Qian Xie (Cornell ORIE)

Joint work with Raul Astudillo, Peter Frazier, Ziv Scully, and Alexander Terenin

ECGI'24

Bayesian Optimization

Goal: optimize expensive-to-evaluate black-box function

$\in$ decision-making under uncertainty

Bayesian Optimization

Goal: optimize expensive-to-evaluate black-box function

$\in$ decision-making under uncertainty

Applications:
Hyperparameter tuning
Drug discovery
Control design

Bayesian Optimization

Goal: optimize expensive-to-evaluate black-box function

∈ decision-making under uncertainty

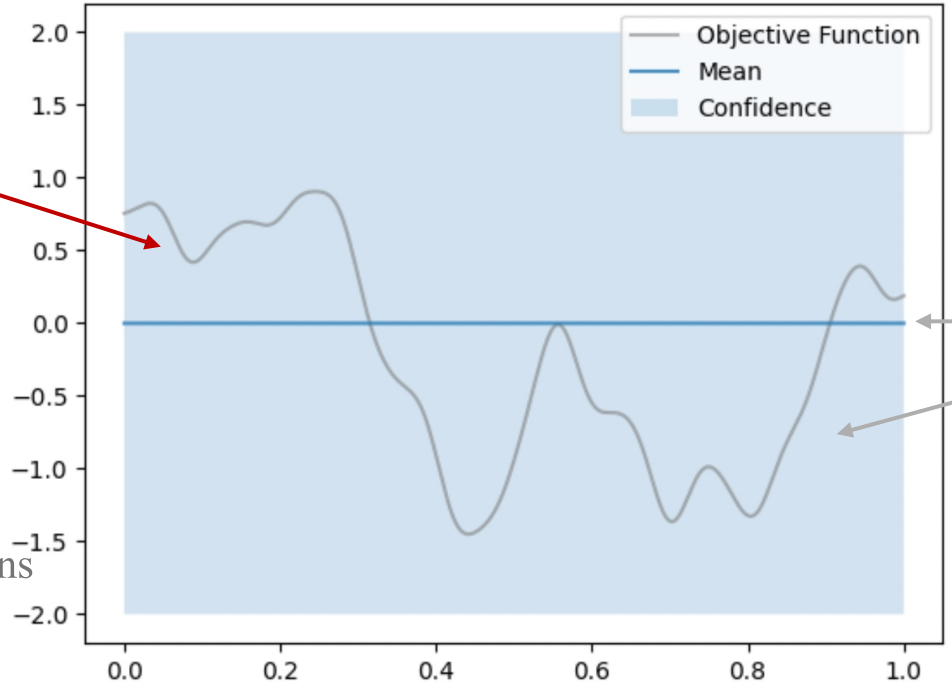
Applications:
Hyperparameter tuning
Drug discovery
Control design

Bayesian Optimization

Goal: optimize expensive-to-evaluate black-box function

An unknown random function $f\colon \mathcal{X} \to \mathbb{R}$ drawn from a Gaussian process prior

Gaussian process: infinite-dimensional generalization of multivariate normal distributions



Applications:
Hyperparameter tuning
Drug discovery
Control design

x: hyperparameter/configuration

mean: prediction

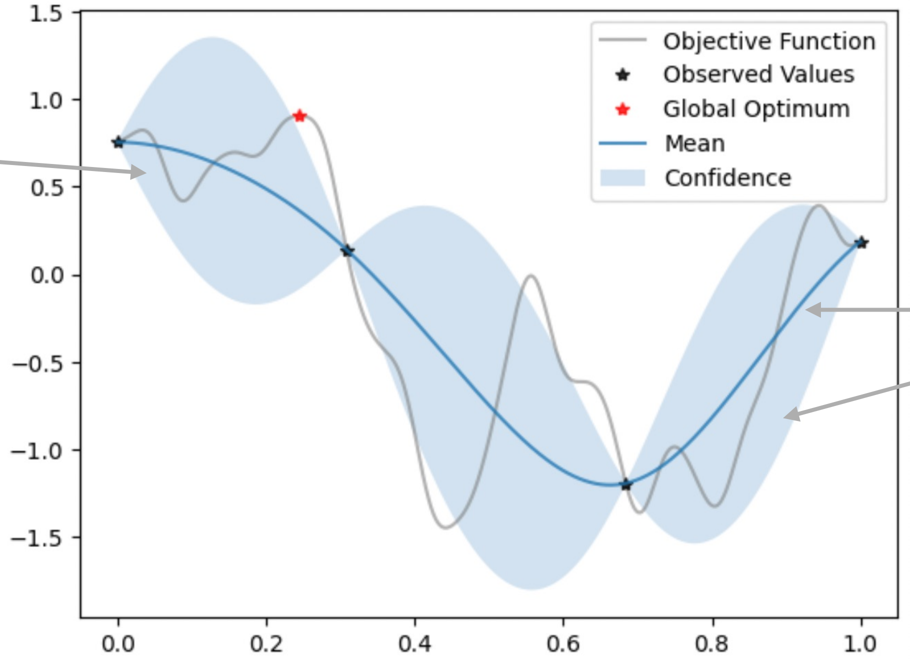
variance: confidence/uncertainty

Bayesian Optimization

Goal: optimize expensive-to-evaluate black-box function

An unknown random function $f: \mathcal{X} \rightarrow \mathbb{R}$ drawn from a Gaussian process prior

Gaussian process: infinite-dimensional generalization of multivariate normal distributions



Applications:
Hyperparameter tuning
Drug discovery
Control design

x: hyperparameter/configuration

mean: prediction

variance: confidence/uncertainty

Objective: find global optimum $x^* = \text{argmax}_{x \in \mathcal{X}} f(x)$

Decision: evaluate a set of points

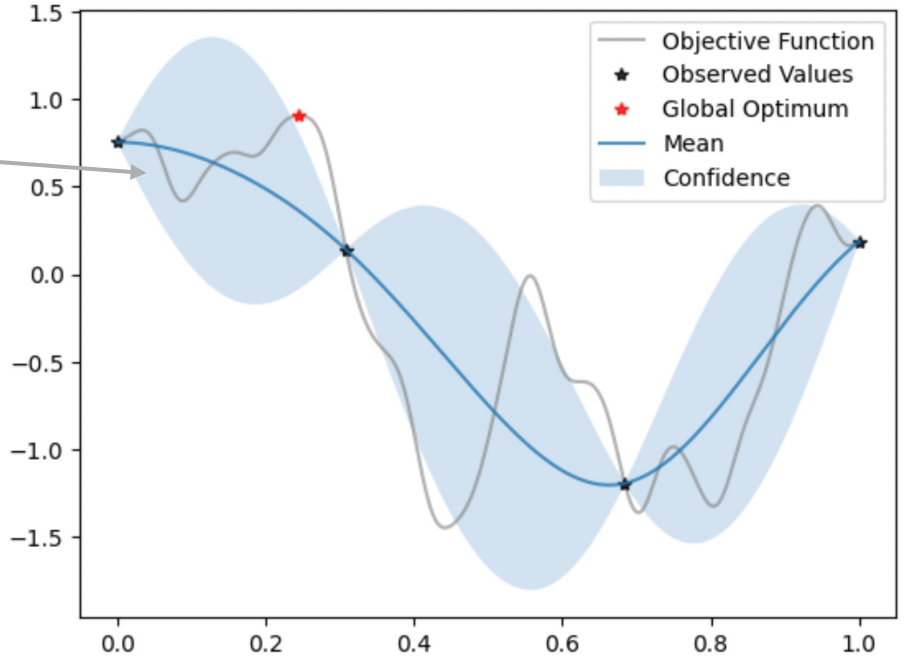
Bayesian Optimization

Goal: optimize expensive-to-evaluate black-box function

Applications:
Hyperparameter tuning
Drug discovery
Control design

x: hyperparameter/configuration

An unknown random function $f\colon \mathcal{X} \to \mathbb{R}$ drawn from a Gaussian process prior



Objective: find global optimum $x^* = \mathrm{argmax}_{x\in\mathcal{X}} f(x)$

Decision: evaluate a set of points

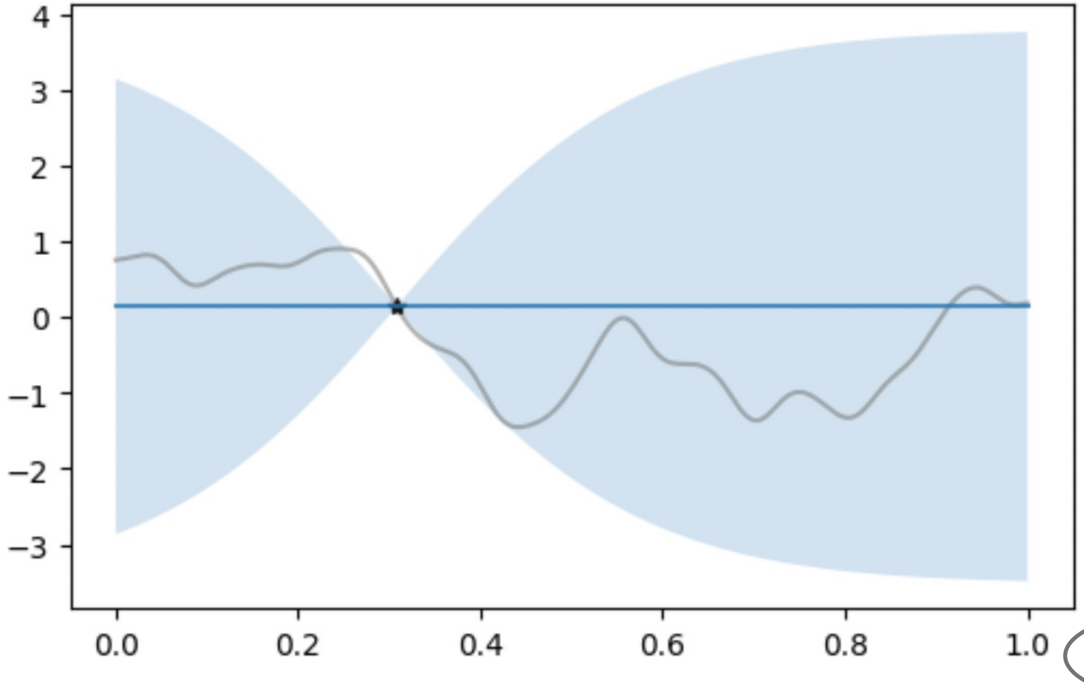
Bayesian Optimization

Goal: optimize expensive-to-evaluate black-box function

Applications:
Hyperparameter tuning
Drug discovery
Control design

x: hyperparameter/configuration

An unknown random function $f: \mathcal{X} \to \mathbb{R}$ drawn from a Gaussian process prior



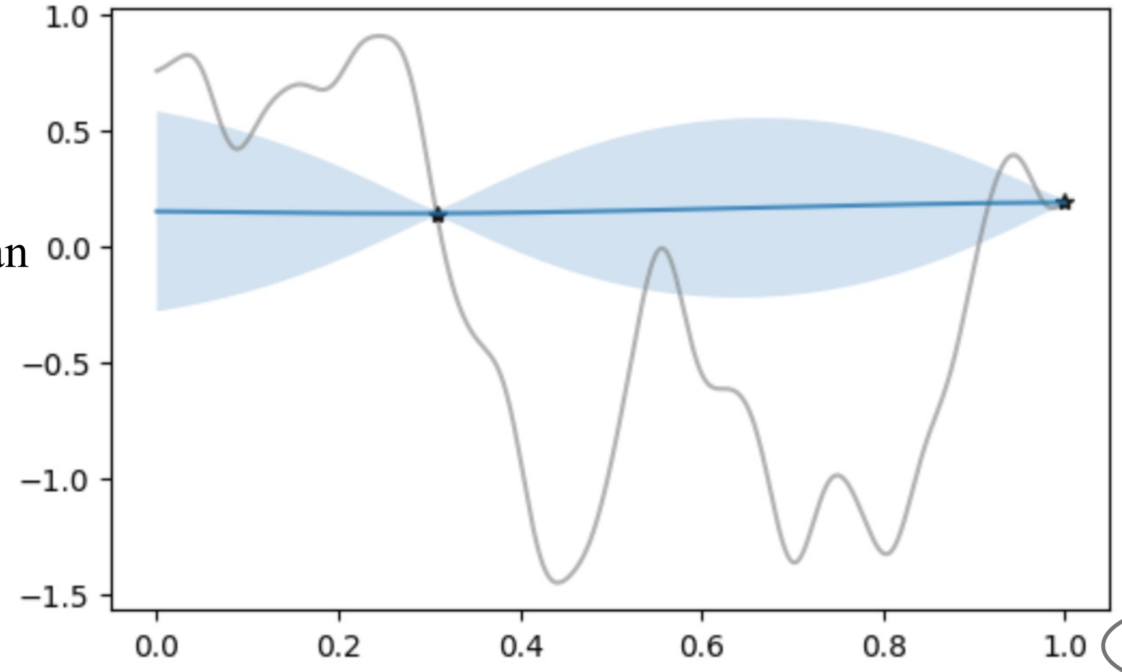
adaptively

Decision: evaluate a set of points

Bayesian Optimization

Goal: optimize expensive-to-evaluate black-box function

An unknown random function $f: \mathcal{X} \to \mathbb{R}$ drawn from a Gaussian process prior



Applications:
Hyperparameter tuning
Drug discovery
Control design

x: hyperparameter/configuration

adaptively

Decision: evaluate a set of points

Bayesian Optimization

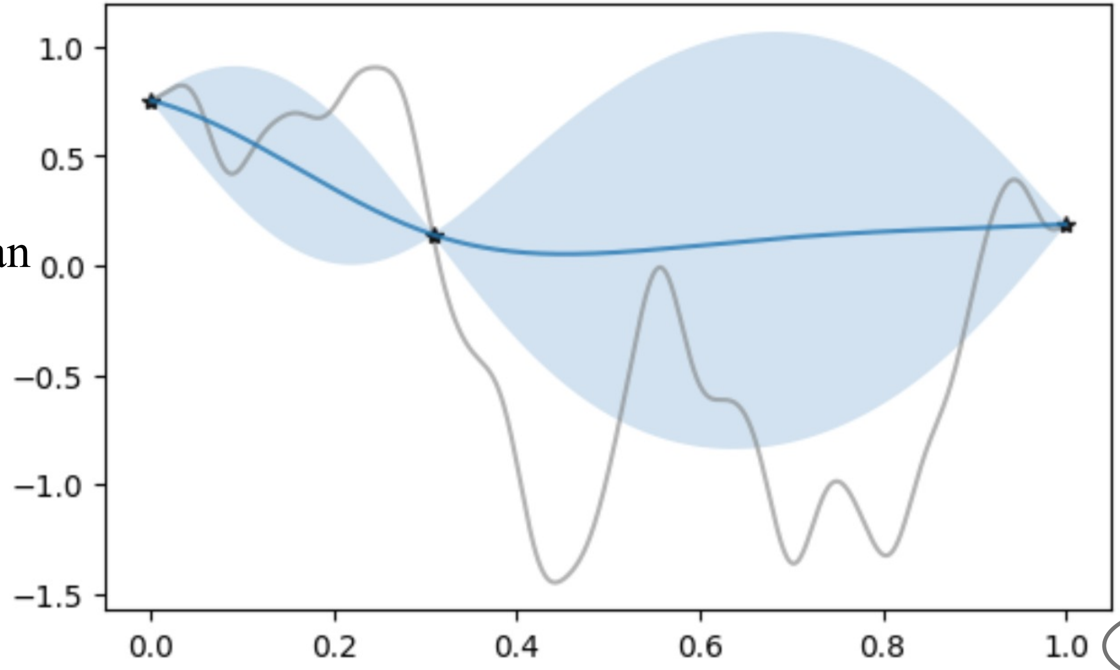
An unknown random function $f: \mathcal{X} \to \mathbb{R}$ drawn from a Gaussian process prior



Applications:
Hyperparameter tuning
Drug discovery
Control design

x: hyperparameter/configuration

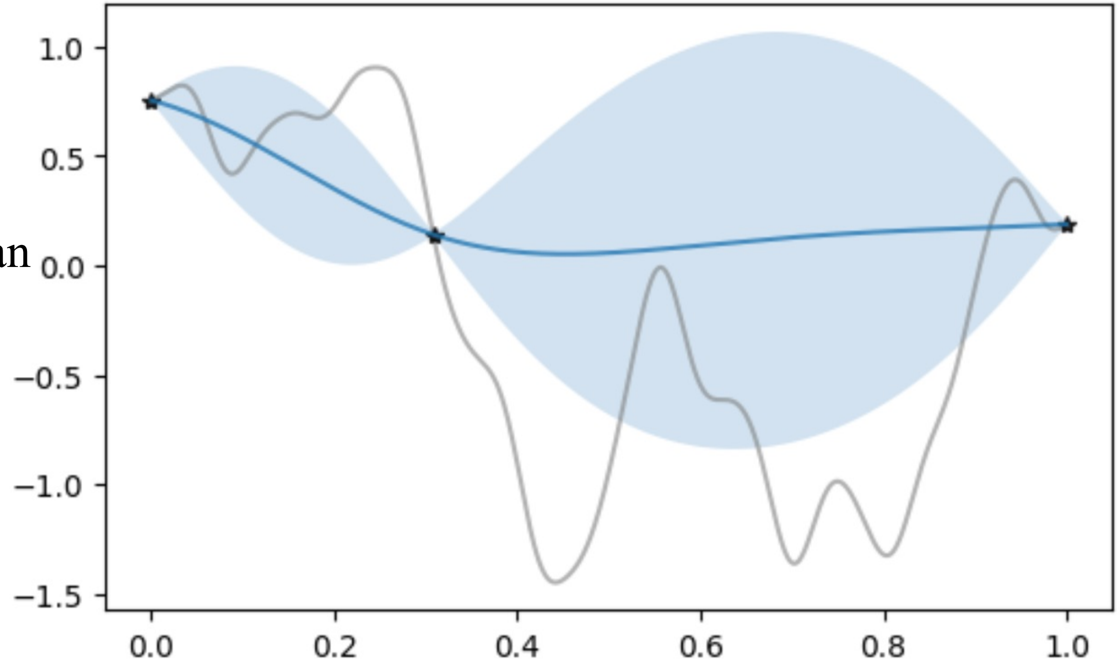
adaptively

Decision: evaluate a set of points

Bayesian Optimization

Goal: optimize expensive-to-evaluate black-box function

An unknown random function $f: \mathcal{X} \to \mathbb{R}$ drawn from a Gaussian process prior



Applications:
Hyperparameter tuning
Drug discovery
Control design

x: hyperparameter/configuration

Decision: adaptively evaluate a set of points

$$x_1, x_2, \dots, x_T \in \mathcal{X}$$

T: time budget

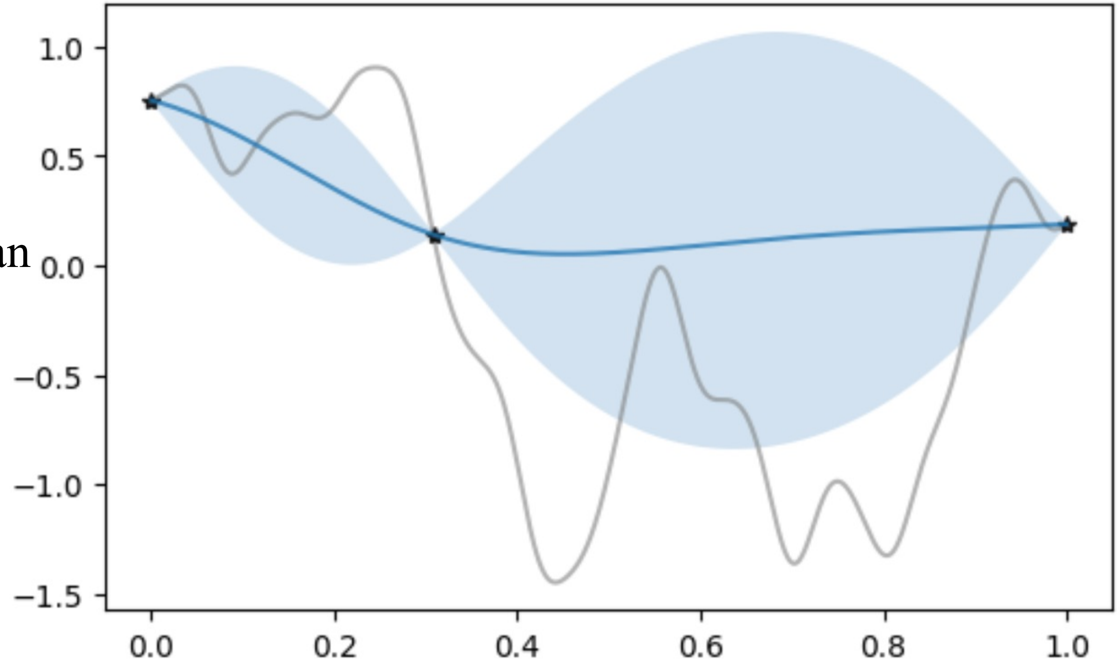
Bayesian Optimization

Goal: optimize expensive-to-evaluate black-box function

Applications:
Hyperparameter tuning
Drug discovery
Control design

x: hyperparameter/configuration

An unknown random function $f: \mathcal{X} \to \mathbb{R}$ drawn from a Gaussian process prior



Objective: optimize best observed value at time T

$$\max_{\text{policy}} \mathbb{E} \max_{t=1,2,\dots,T} f(x_t)$$

Decision: adaptively evaluate a set of points

$$x_1, x_2, \dots, x_T \in \mathcal{X}$$

T: time budget

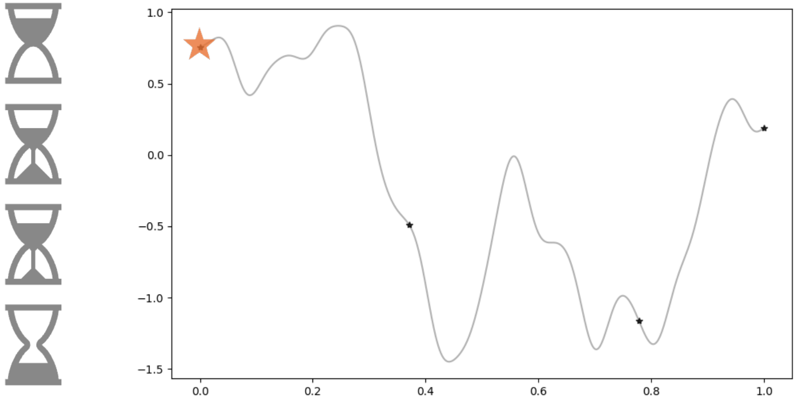
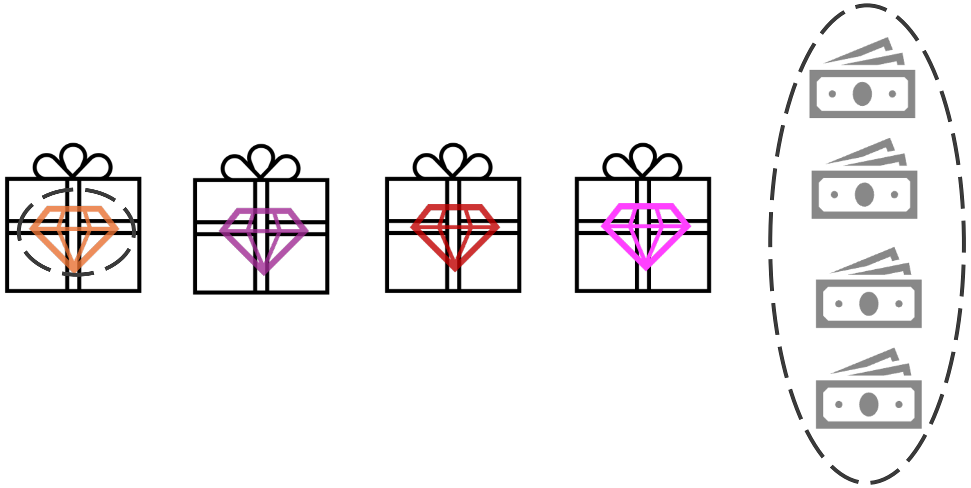
- Show performance against baselines on synthetic & empirical experiments





Our work $\Longleftarrow$ Pandora's Box Gittins index

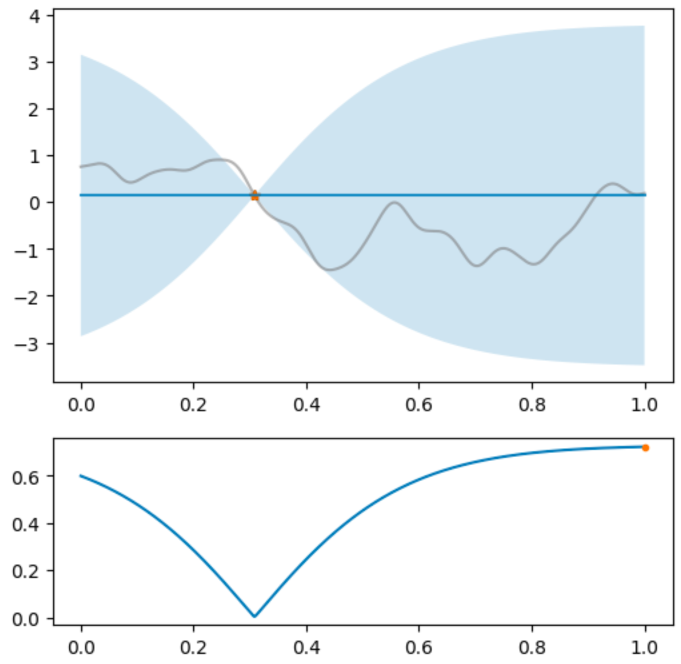
How is our PBGI policy different from baselines?

Popular One-step Heuristic: EI



Expected improvement

$$\mathrm{EI}(x; y) = \mathbb{E}[(f(x) - y)^+]$$

EI policy: evaluate $\mathrm{argmax}_x\ \mathrm{EI}(x; y_{\mathrm{best}})$

mean: prediction

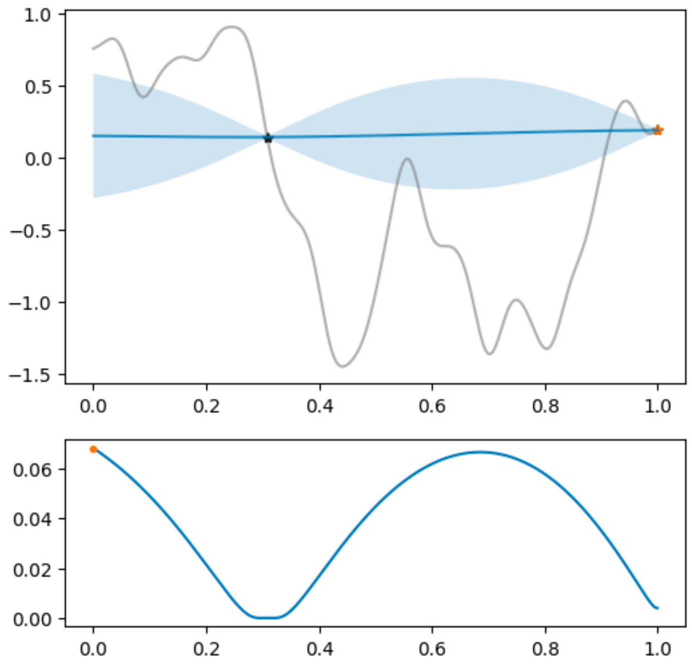
variance: confidence/uncertainty

Trade-off between

- exploitation (high mean) and
- exploration (high uncertainty)

y_{best}: current best observed value

Popular One-step Heuristic: EI



mean: prediction

variance: confidence/uncertainty

Trade-off between

- exploitation (high mean) and
- exploration (high uncertainty)

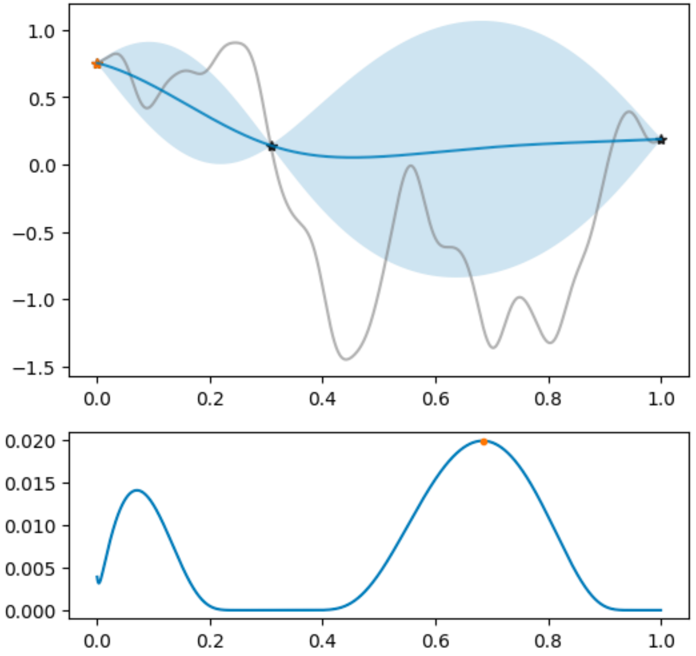
Expected improvement

$$\mathrm{EI}(x; y) = \mathbb{E}[(f(x) - y)^+]$$

EI policy: evaluate $\mathrm{argmax}_x\ \mathrm{EI}(x; y_{\mathrm{best}})$

y_{best}: current best observed value

Popular One-step Heuristic: EI



Expected improvement

$$\mathrm{EI}(x; y) = \mathbb{E}[(f(x) - y)^+]$$

EI policy: evaluate $\mathrm{argmax}_x\ \mathrm{EI}(x; y_{\mathrm{best}})$

mean: prediction

variance: confidence/uncertainty

Trade-off between

- exploitation (high mean) and
- exploration (high uncertainty)

y_{best}: current best observed value

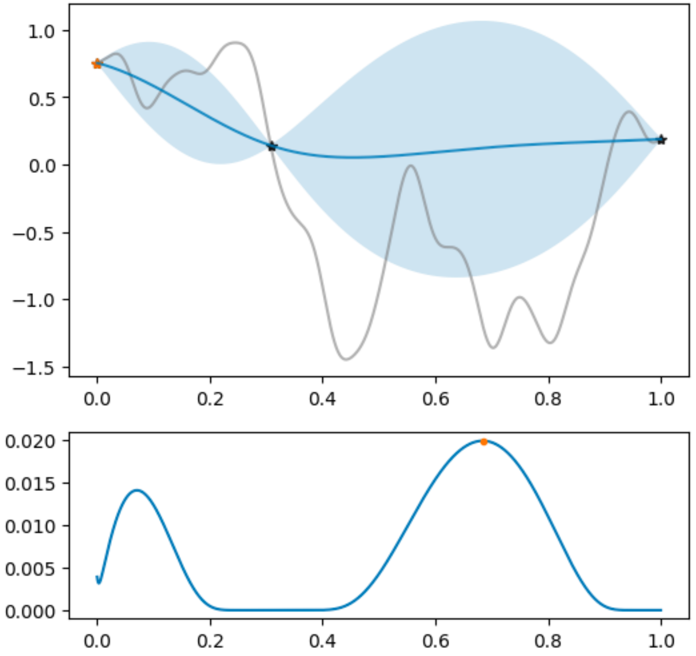
Popular One-step Heuristic: EI

Other heuristics:

simple

- Upper Confidence Bound
- Thompson Sampling (TS)
- Predictive Entropy Search
- Knowledge Gradient
- Multi-step Lookahead EI

slow



Expected improvement

mean: prediction

variance: confidence/uncertainty

Trade-off between

- exploitation (high mean) and
- exploration (high uncertainty)

$$\mathrm{EI}(x; y) = \mathbb{E}[(f(x) - y)^+]$$

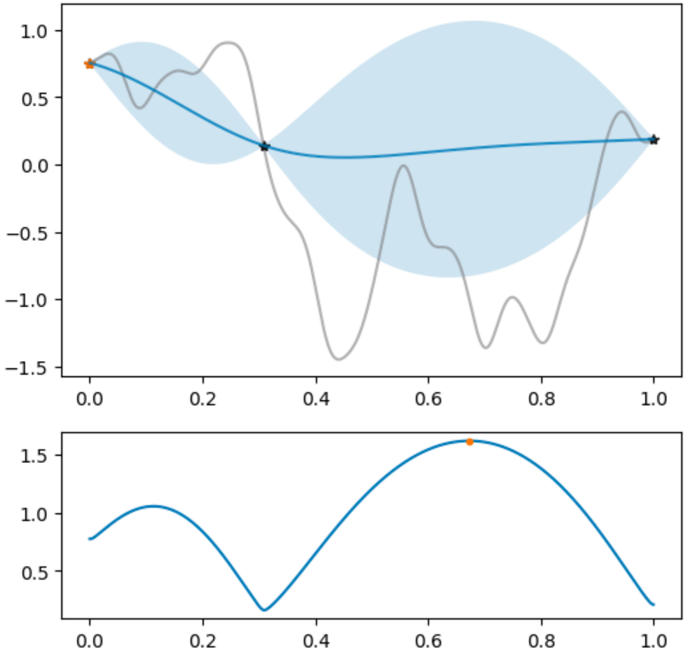
y_{best}: current best observed value

EI policy: evaluate $\mathrm{argmax}_x\ \mathrm{EI}(x; y_{\text{best}})$

New One-step Heuristic: PBGI

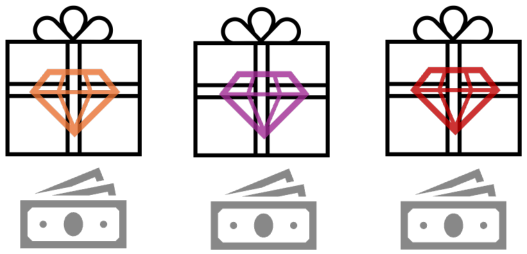
Other heuristics:

- Upper Confidence Bound
- Thompson Sampling (TS)
- Knowledge Gradient
- Predictive Entropy Search
- Multi-step Lookahead EI



Pandora's box Gittins index

Pandora's box



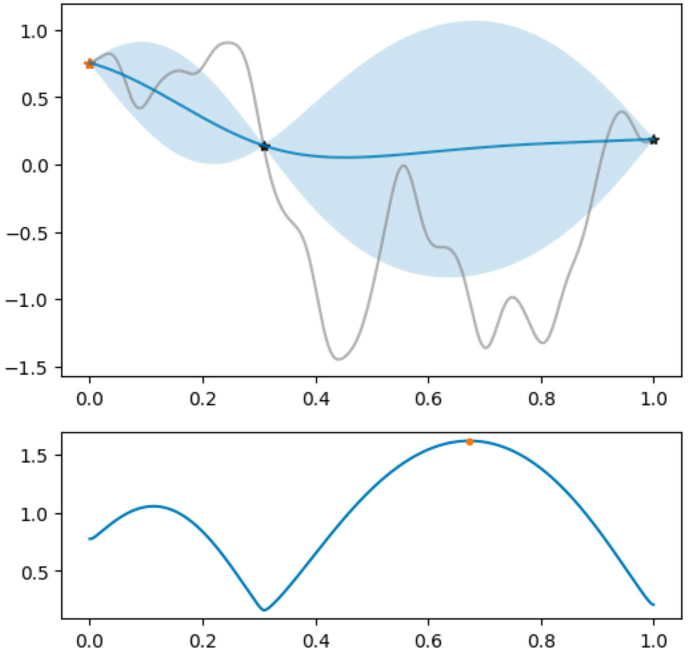
$g(x)$: Gittins index function

PBGI policy: evaluate $\text{argmax}_x\, g(x)$

New One-step Heuristic: PBGI

Other heuristics:

- Upper Confidence Bound
- Thompson Sampling (TS)
- Knowledge Gradient
- Predictive Entropy Search
- Multi-step Lookahead EI



Pandora's box Gittins index

$$\mathrm{EI}(x; y) = \mathbb{E}[(f(x) - y)^+]$$

PBGI policy: evaluate $\operatorname{argmax}_x g(x)$

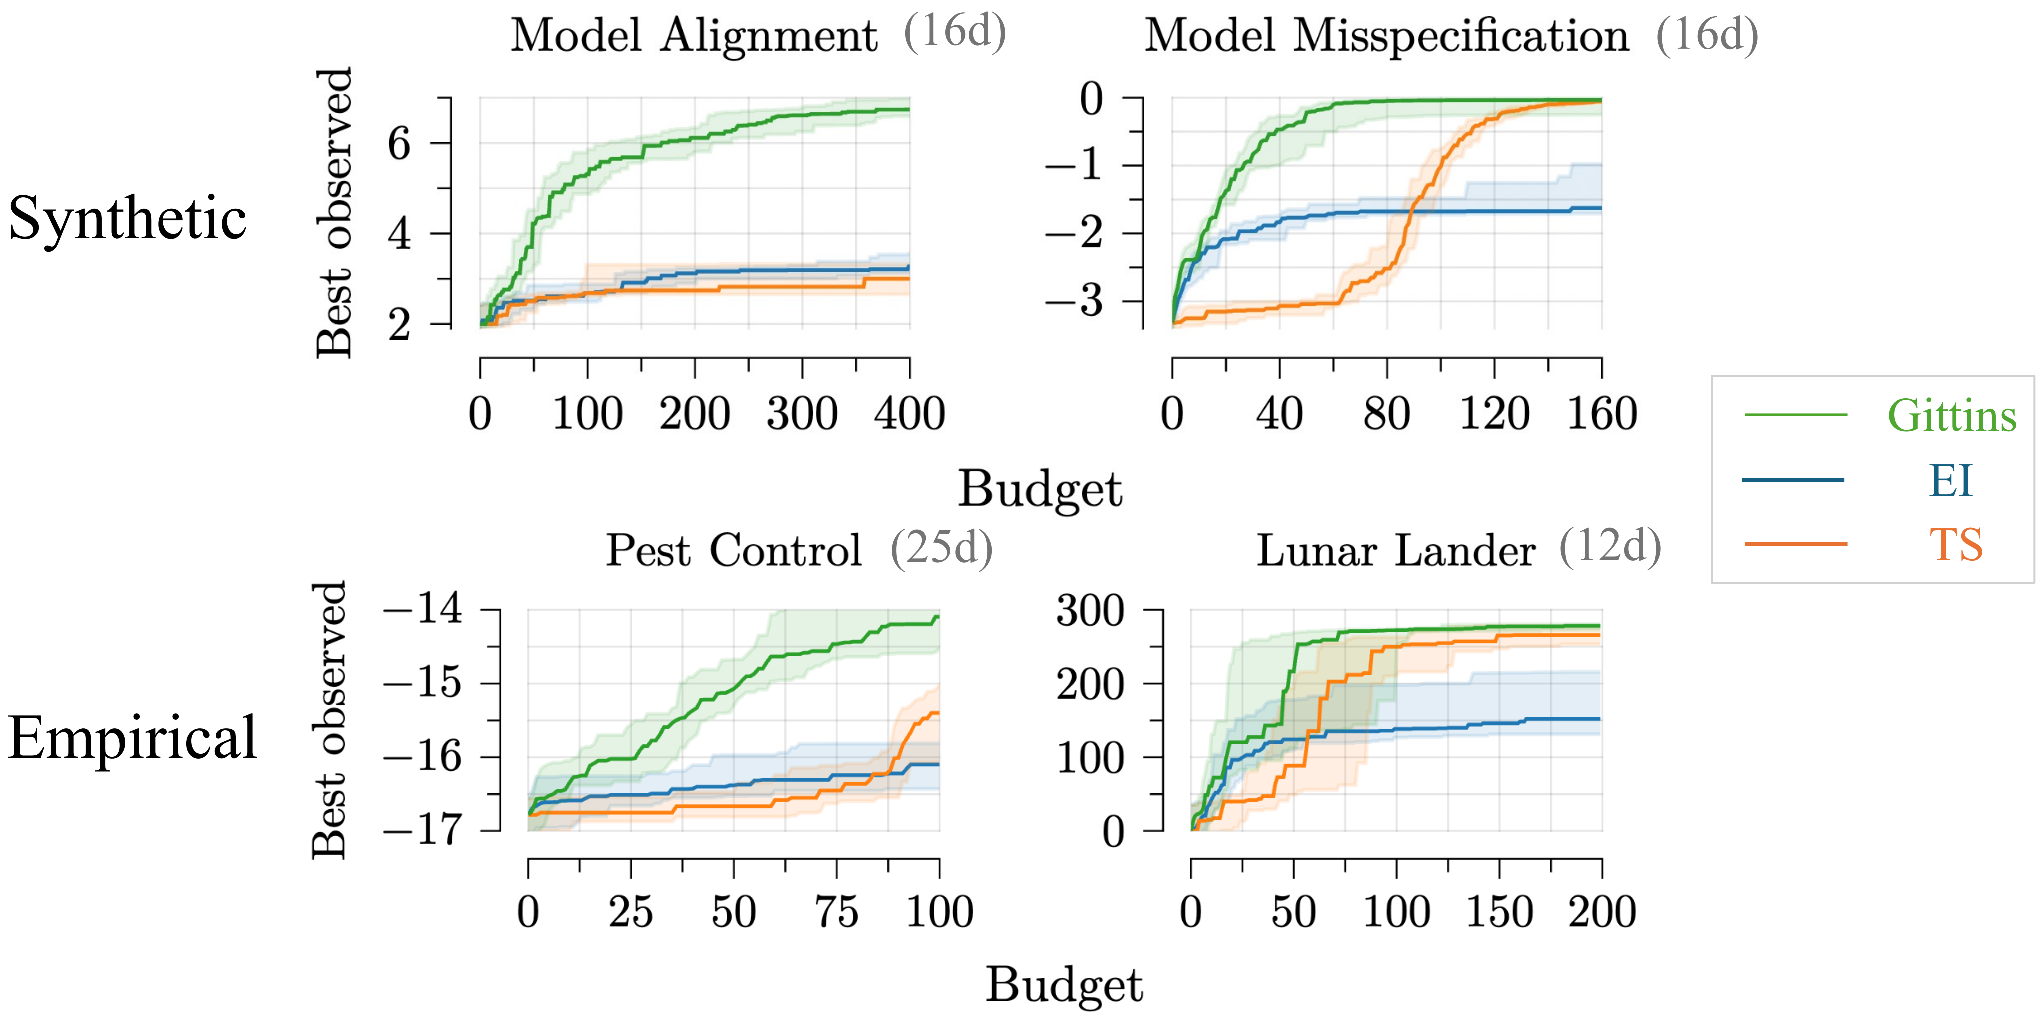
Pandora's box

λ λ λ

λ: cost per sample

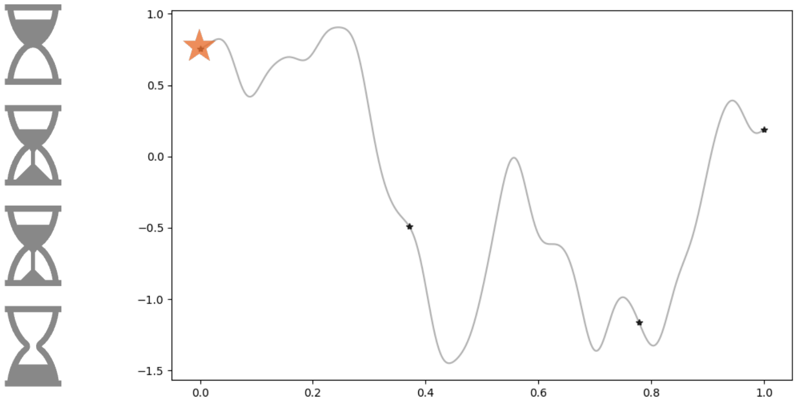
$g(x)$: solution to $\mathrm{EI}(x; g(x)) = \lambda$

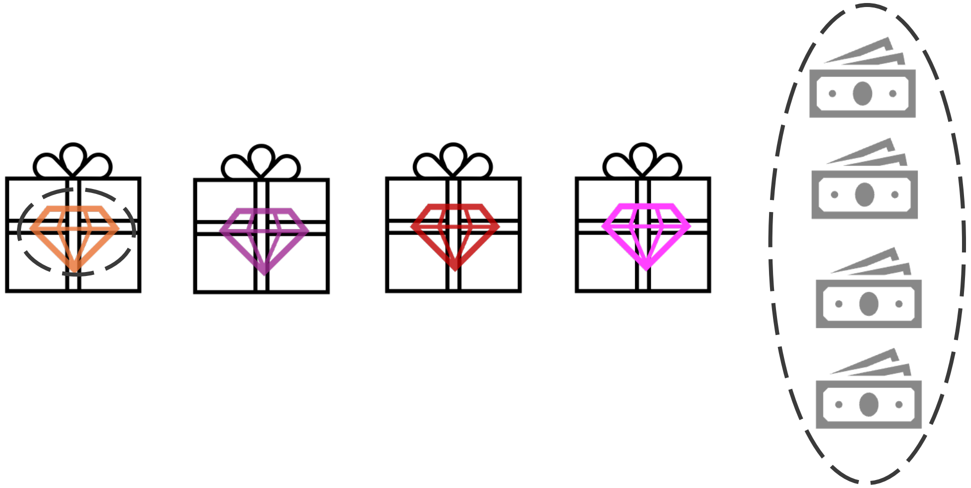
Experiment Results: Gittins vs EI vs TS



Conclusions

- Propose easy-to-compute PBGI policy for Bayesian optimization





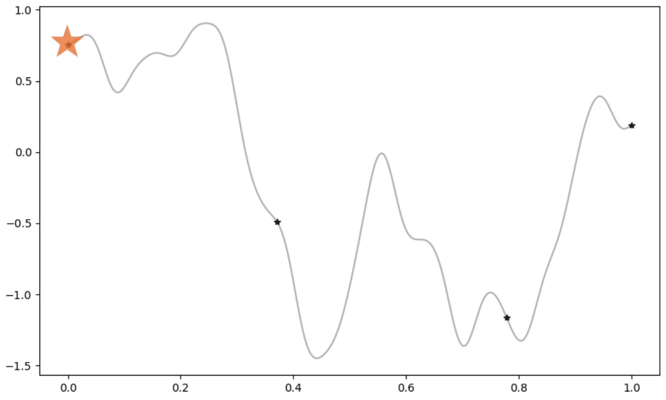
Our work $\Longleftarrow$ Pandora's box Gittins index

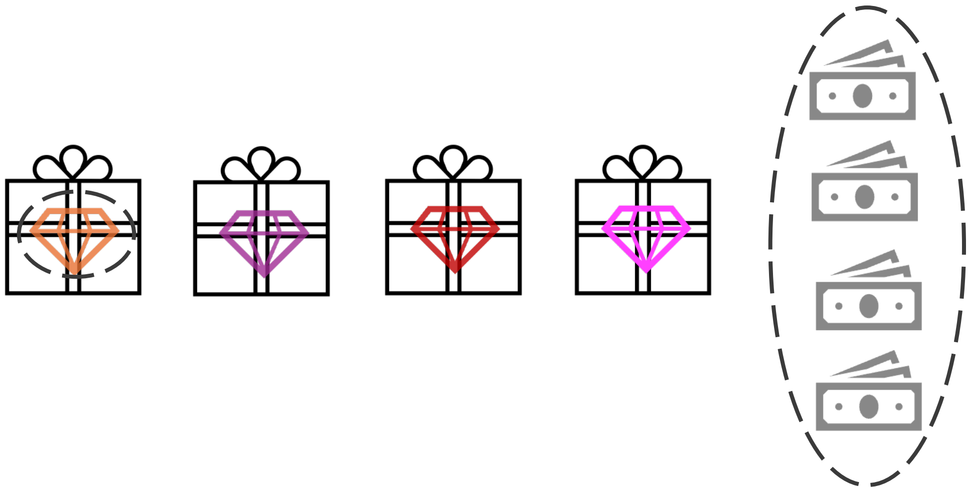
Check our preprint on ArXiv!

Conclusions

- Propose easy-to-compute PBGI policy for Bayesian optimization
- Show PBGI mostly outperforms baselines on synthetic & empirical experiments

  particularly on medium-high dimensions and relatively-large domains!



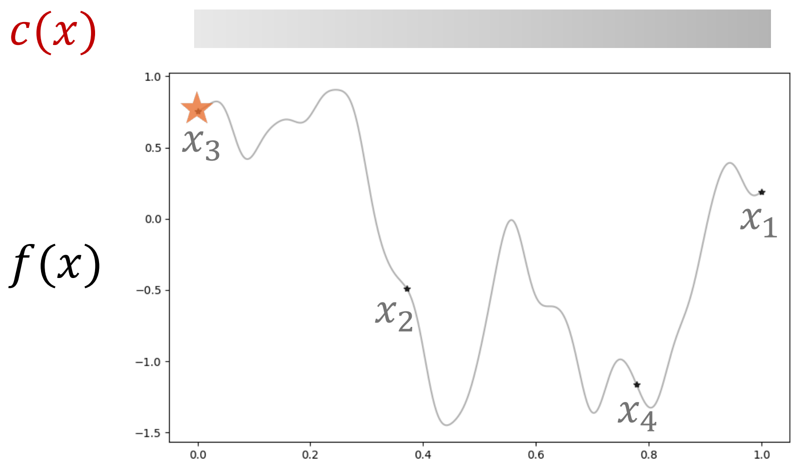


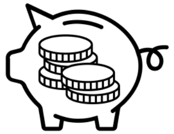
Our work ⟸ Pandora's box Gittins index

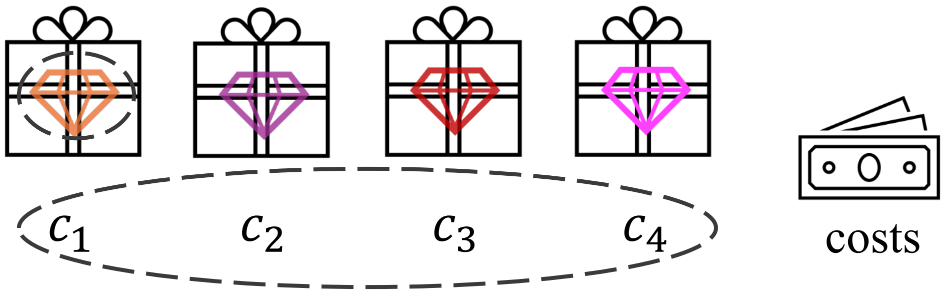
Check our preprint on ArXiv!

Conclusions

- Propose easy-to-compute Gittins index function for Bayesian optimization
- Show PBGI mostly outperforms baselines on synthetic & empirical experiments
- Extend to Bayesian optimization with heterogeneous evaluation costs





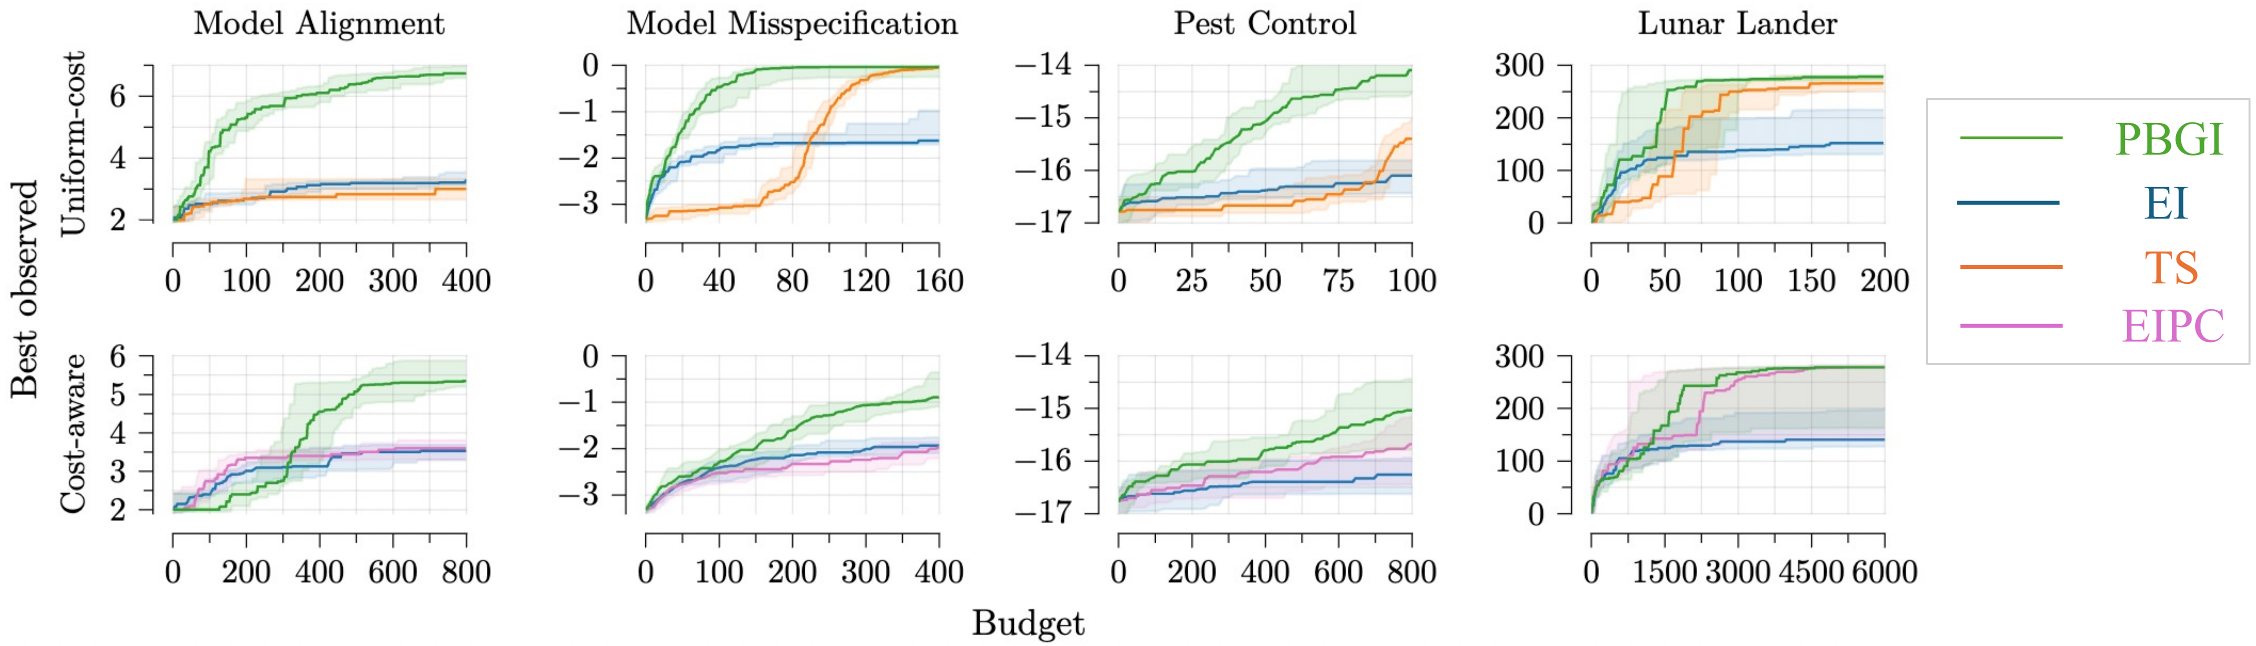


Our work $\Longleftarrow$ Pandora's Box Gittins index

Check our preprint on ArXiv!

Heterogeneous-cost Experiment Results

- Show PBGI mostly outperforms baselines on synthetic & empirical experiments
- Extend to Bayesian optimization with heterogeneous evaluation costs



Check our preprint on ArXiv!

Conclusions

- Propose easy-to-compute PBGI policy for Bayesian optimization
- Show PBGI mostly outperforms baselines on synthetic & empirical experiments
- Extend to Bayesian optimization with heterogeneous evaluation costs
- Open door for exotic BO (freeze-thaw, multi-fidelity, function network, etc.)
